Lesson Outline for Teaching

Lesson 1: Sexual Reproduction and Meiosis

- **A.** What is sexual reproduction?
 - **1.** <u>Sexual reproduction</u> produces an offspring when genetic materials from two different sex cells combine.
 - **a.** The female sex cell, a(n) egg, forms in an ovary.
 - **b.** The male sex cell, a(n) sperm, forms in a testis.
 - **2.** During a process called <u>fertilization</u>, an egg cell and a sperm cell join together. The new cell that forms is called a(n) <u>zygote</u>.

B. Diploid Cells

- 1. Organisms that reproduce sexually make two kinds of cells—body cells and sex cells.
- **2.** Body cells are <u>diploid</u>; they have pairs of chromosomes.
- **3.** If a zygote has too many or too few <u>chromosomes</u>, it will not develop properly.
- **4.** Different organisms have different <u>numbers</u> of chromosomes.
- **5.** <u>Homologous chromosomes</u> are pairs of chromosomes that have genes for the same traits arranged in the same order.

C. Haploid Cells

- **1.** Sex cells are <u>haploid</u>; they have only one chromosome from each pair of chromosomes.
- 2. In meiosis, one diploid cell divides and makes four haploid cells.

D. The Phases of Meiosis

- **1.** Meiosis involves two divisions of the nucleus and the <u>cytoplasm</u>. These divisions, known as meiosis I and meiosis II, result in four haploid cells.
- 2. During interphase, the reproductive cell grows and duplicates its chromosomes.
- **3.** During meiosis I, each pair of duplicated homologous chromosomes separates.
- **4.** After meiosis I, the two cells formed during this stage go through a second division of the <u>nucleus</u> and cytoplasm called meiosis II. During meiosis II, sister <u>chromatids</u> separate to produce four haploid cells.

E. Why is meiosis important?

- **1.** Meiosis forms sex cells with the correct haploid number of <u>chromosomes</u>. This maintains the correct <u>diploid</u> number of chromosomes in organisms when sex cells join.
- **2.** Meiosis creates genetic variation by producing <u>haploid</u> cells.

Lesson Outline continued

- **F.** How do mitosis and meiosis differ?
 - **1.** During <u>mitosis</u> and cell division, a body cell and its nucleus divide once and produce two identical cells.
 - **2.** During <u>meiosis</u>, a reproductive cell and its nucleus divide twice and produce four cells—two pairs of identical haploid cells.
- **G.** Advantages of Sexual Reproduction
 - **1.** Sexual reproduction produces <u>offspring</u> that have a new combination of DNA. This results in genetic <u>variation</u> among individuals.
 - **2.** Genetic variation gives individuals within a population slight differences that might be an advantage if the <u>environment</u> changes.
 - 3. Selective breeding has been used to develop desirable traits in plants and animals.
- **H.** Disadvantages of Sexual Reproduction
 - **1.** One disadvantage of sexual reproduction is that organisms have to grow and develop until they are mature enough to produce <u>sex</u> cells.
 - **2.** Another disadvantage is that searching for a mate takes time and energy and might expose individuals to predators, <u>diseases</u>, or harsh environmental conditions.

Discussion Question

What are some disadvantages of sexual reproduction?

Organisms have to grow and develop until they are mature enough to produce sex cells. Searching for a mate takes time and energy and might expose individuals to predators, diseases, or harsh environmental conditions.
